Project Overview

- Problem: The Rising Cost of Cybersecurity Breaches
  - Average Data Breach Cost: $4.45 million (Forbes)
  - Projected Cybercrime Damages: Over $10 Trillion by 2025 (Forbes)
- Our Solution: ScanMasterX
- Our Vision:
  - Lower the barrier to scan and analyze complex networks
  - Prevent Data Breaches by accessing vulnerable services
  - Perform Security testing
  - Display the Topology and Rating

Requirements List

- There must be a feature to identify vulnerabilities on a server.
- There must be a component that will evaluate the security of the ports on a given server.
- The user must be able to select which device(s), which ports, or which group of ports, that they wish to test and scan.

Project Solution Approach

- Major Components
  - Custom scanner leveraging Nmap
  - GUI for user to interact with

- Tools, Frameworks, Platforms, Libraries
  - PYQT - UI framework for Python
  - NMAP – A CLI network scanner
  - CVE Database [TBD]

Use Case Modeling

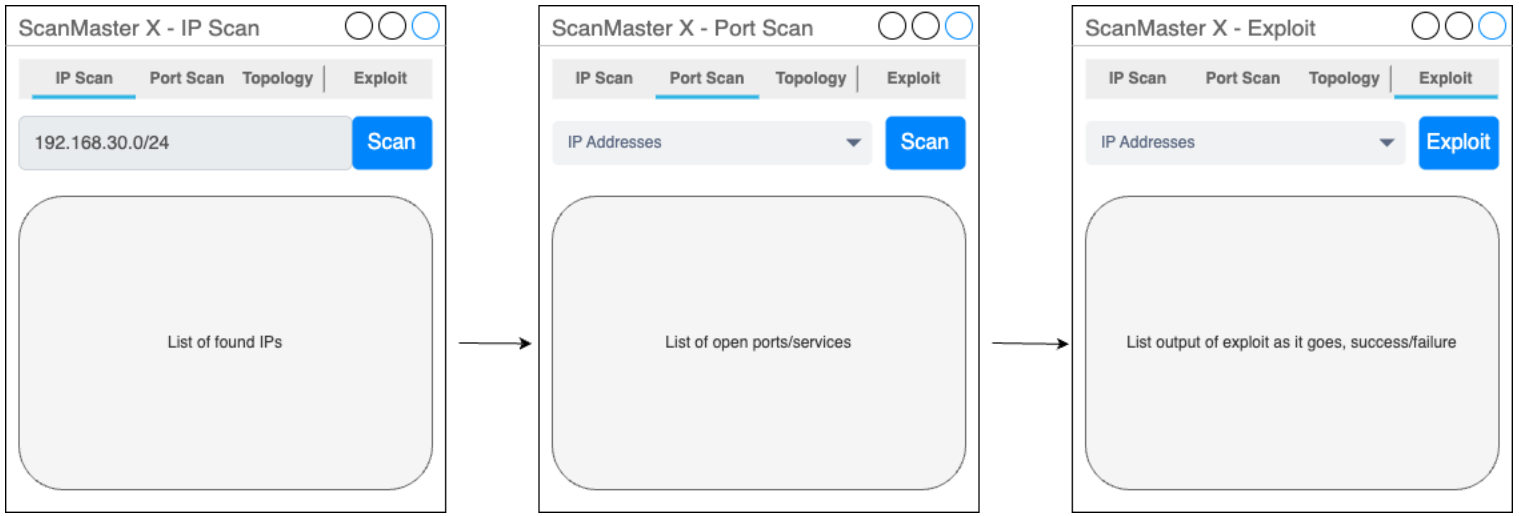
Screenshots (UI, Code, if any)



Demo Time on Exploits!

```python
class Pen_Tester:

    def __init__(self):
        self.exploits = [self.login_to_ftp,]

    def run_exploits(self,machine):

        for exploit in self.exploits:
            result = exploit(machine.IP)
        return result

    def login_to_ftp(self,host):
        try:
            with ftplib.FTP(str(host)) as ftp:
                print("IM TRYING TO LOG IN")
                ftp.login()
                print("Login successful!")
                return True
        except ftplib.all_errors as e:
            print(f"Failed to connect or login: {e}")
            return False
```

What's Next??

- Development of the UI
- Displaying the Topology
- Identifying Vulnerabilities
